

38. (newly added) Apparatus comprising:

 an automated teller machine (ATM), wherein the ATM includes a plurality of function devices;

at least one camera adjacent the ATM, wherein the camera is operative to produce camera signals corresponding to at least one human image;

a computer in operative connection with a data store and the at least one camera, wherein the computer is operative to store image data corresponding to the camera signals in the data store responsive to operation of a selected function device, wherein the computer is operative to store the image data on a first date;

at least one communication network in operative connection with the data store;

a terminal in operative connection with the network and the data store, wherein the terminal is remotely located from the ATM, wherein the terminal includes a display device, wherein the terminal is operative to receive retrieved stored image data on a second date different from the first date, and wherein the terminal is operative to display images corresponding to the retrieved image data through the display device.

39. (newly added) The apparatus according to claim 38 wherein the function devices comprise transaction function devices, wherein the computer is operative to store image data corresponding to the camera signals in the data store responsive to operation of a selected transaction function device during an ATM transaction.

40. (newly added) The apparatus according to claim 39 wherein the camera is operative to produce camera signals corresponding to a customer of the ATM, and wherein the terminal is operative to display images corresponding to customer image data through the display device.

41. (newly added) Apparatus comprising:

an automated teller machine (ATM) including a plurality of transaction function devices;

at least one image device adjacent the ATM, wherein the at least one image device is operative to produce signals corresponding to images;

a computer including a server in operative connection with a data store, wherein the computer is in operative connection with the ATM, and wherein responsive to the ATM carrying out at least one ATM transaction function through operation of at least one transaction function device, the computer is operative at a first time to cause image data corresponding to the signals to be included in the data store;

at least one network in operative connection with the server;

a user terminal remotely located from the ATM and in operative connection with the network, wherein the user terminal includes an output device, and wherein the user terminal is operative to communicate with the server and to output images corresponding to the image data through the output device at a second time subsequent to the first time.

42. (newly added) The apparatus according to claim 41 wherein the at least one image device is located in an interior of the ATM.

43. (newly added) The apparatus according to claim 42 wherein the server and the data store are located in the interior of the ATM.
